Instructions: How to import the schema using Python.

1. first make sure you have pymysql added using pip install pymysql (you probably already done this).
2. run the command import pymysql.
3. run the command pymysql.install_as_MySQLdb(). This installs the pymysql as a mysql driver.
4. next make sure you have the latest github repository installed.
5. run the command from thebattersbox.Database import db.
6. run the command db.create_all() (keep in mind if the schema has already been created this will fail)

note if you need to rerun the database create script you can drop the entire schema and remake it but make sure you create a blank schema called 'thebattersbox'
